DETAILED ACTION

1. Claims 1-to-22 are pending in the application.

EXAMINER'S AMENDMENT

2. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Joanna K. Mason in October, 2005.

In order to avoid a 112 2nd Paragraph, the following claims have been amended.

➤ **Replace Claim 1 with:**

A method for generating orthogonal spread codes in a mobile communication system, comprising:

generating a first square matrix having a size of powers of 2 by operating an initial 2x2 matrix;

generating a second square matrix of same size of the first square matrix by operating the first square matrix;

composing a third square matrix of double size of the first square matrix, arranging the second square matrix as a first quarter matrix of the third square matrix, wherein the third square matrix is composed by arranging the first square matrix as a second quarter matrix and a third quarter matrix of the third square matrix, and arranging the second square matrix as a fourth quarter matrix of the

third square matrix by multiplying all elements of the second square matrix by -1;
making a deformed matrix by inserting a zero vector between a column
or a row of the third square matrix; and
generating orthogonal spread codes for channel discrimination from the
rows or columns of the deformed matrix.

Allowable Subject Matter

3. Claims 1-22 are allowable over the prior art of record because the cited references do not contain the specified limitation of a method for generating orthogonal spread codes in a mobile communication system, comprising:
generating a first square matrix having a size of powers of 2 by operating an initial 2x2 matrix; generating a second square matrix of same size of the first square matrix by operating the first square matrix; composing a third square matrix of double size of the first square matrix, arranging the second square matrix as a first quarter matrix of the third square matrix, wherein the third square matrix is composed by arranging the first square matrix as a second quarter matrix and a third quarter matrix of the third square matrix, and arranging the second square matrix as a fourth quarter matrix of the third square matrix by multiplying all elements of the second square matrix by -1; making a deformed matrix by inserting a zero vector between a column or a row of the third square matrix; and generating orthogonal spread codes for channel discrimination from the rows or columns of the deformed matrix.
